

earnival

Every event is a temporary economy. Nobody banks it.

Earnival is the payment, storefront and settlement layer for the economy that comes alive whenever people gather — tickets, vendor shops, cashless payment, the gate, and automatic payouts on one link.

Seed round · Lagos, Nigeria

A live event page, as it unfurls when the link is shared.

THE PROBLEM

The money moves. The record doesn't.

Nigerian events run on cash and scattered bank transfers. When the gates close, every trail dies — and the pain lands differently on each side of the same transaction.

Organisers

Create the footfall, capture only ticket revenue. The food, merch and art that sold because of their event is invisible to them — and earns them nothing.

Vendors

Lose revenue the moment a customer pays into an unauthorised account. No storefront that outlives the night, and no record of anyone who bought.

Attendees

Queue to buy, settle for a second choice because the vendor silently ran out, and lose every seller they discovered when the event ends.

No existing rail treats the event as the organising unit of commerce — ticketing, storefronts, cashless payment, orders, pickup and settlement in one connected system.

EVIDENCE

We have run this three times, by hand.

Three Earnival-operated pilots, before any of this was software. When a cashless rail exists, the majority of spend moves onto it — including at an event with no tickets at all.

~80%

OF IN-EVENT SALES ONLINE

DDP end-of-year party series, 2023-2025
>2,000 people · 6 vendors

4-month season · 11 vendors

>1,000

PEOPLE, NON-TICKETED

Lere to the World, 2025
4 vendors · rail still worked

Honest framing: these are founder-reported pilot figures without an instrumented dashboard behind them. The platform now carries its own telemetry, so the next event is measured, not estimated.

WHY NOW

A seasonal economy the size of a small country.

\$21.8bn

Diaspora remittance

Dollars looking for a trusted way to spend into events at home

¥39.6bn

Detty December spend

~3.6m participants — the seasonal peak of the event economy

\$384.5m

Festive air travel

Travel demand tied directly to the event season

\$14.8bn

Creative economy (2025)

The macro backdrop Earnival's category sits inside

Founder field research — figures to be re-sourced with citations before any data room.

THE SOLUTION

One link does all of it.

That link sells tickets, hosts the vendors' shops, takes cashless payment for both, gets everyone through the gate, and pays every party what they are owed — with the split agreed in advance and visible to both sides before anyone accepts.

The vitamin

Tickets that work — bought without an account, delivered by email, scannable at a gate that keeps working offline.

The painkiller

Vendors sell cashless from a permanent storefront and get paid automatically, without chasing anyone.

The steroid

The organiser earns a share of every vendor sale their event created — a revenue line that did not exist for them before.

The public event page

Thirty seconds, no account, no app.

Anyone can buy with a name, an email and a phone number. The ticket arrives as a signed QR badge; orders from several shops in one basket become one order per shop, each tracked separately.

Buy a ticket

The badge that gets you in

Vendor storefront

Track the order

The Connection: a governed link that carries money.

A shop is only purchasable through an event it has an ACTIVE connection with. The revenue share is agreed up front, shown as a worked example before anyone accepts, and snapshot onto every order — so a later edit can never rewrite an existing order's split.

No blind accepts

The organiser sees exactly what each party receives on a sample sale.

Terms are snapshot

Edits apply to future orders only.
History is immutable.

This is the flywheel

Organisers recruit vendors;
vendors recruit each other.

A revenue line that did not exist before.

What the organiser now sees

- Ticket revenue, net of all fees
- Their share of every vendor sale
- Shop GMV the event generated
- Tickets sold against capacity
- Live check-in progress
- A funnel: opens, checkout starts, purchases

Before Earnival, the last three of these did not exist for an organiser at all.

Earnival service charge (75%)	- €14,737.50
Organiser share (connection)	- €9,825
YOUR NET	€171,937.50

[Go to organiser console →](#)

The shop has its own URL and QR. It survives every event it connects to, and carries its customers with it.

Service charge, organiser share and vendor net are computed in integer kobo. Rounding remainders go to the vendor — they never evaporate.

Settlement claims ledger entries atomically, then pays out to a bank account verified with the bank first.

The night is when software gets judged.

A venue with no signal, a queue at the gate, and a dead phone battery are not edge cases — they are Saturday. Check-in queues scans on the device and syncs when connectivity returns, each carrying an idempotency key so a replay cannot double-register anyone.

Live build. Demonstration data.

A real check-in, captured live — the counter moves, the guest is confirmed, and the session count increments.

Staff are invited by email with capabilities mapped one by one — check in, edit, manage shops, issue refunds.

Works offline

Scans queue on the device and sync later. The gate never stops because the network did.

Forgery fails first

QR payloads are signed. An edited code is rejected before any database lookup.

More than one phone

Door staff and cohosts check guests in without ever seeing revenue.

Risk is priced into the product, not bolted on.

Sellers climb a verification ladder. Each rung raises what they can earn per event and how fast they get paid — so the platform's exposure to an unverified seller is bounded by design.

L3 CAC + TIN

Unlimited · verified badge · daily settlement

BVN, NIN and TIN are encrypted at rest under a key held separately from the session secret. Only the last four digits are ever displayed — including to our own reviewers.

An append-only ledger, and money that leaves.

The five invariants

- Money is integer kobo. No floating point anywhere in the money path.
- Prices come from the database. Checkout accepts only IDs and quantities.
- Inventory is reserved by conditional SQL, so concurrent buyers cannot oversell.
- Only a signature-verified webhook can mark a payment successful.
- The ledger is append-only. Balances are sums, never stored numbers.

FLOATS IN THE MONEY
PATH

We take 7.5%, and we show our working.

A service charge of 7.5% is deducted from the seller per transaction. Processing fees are added to the buyer's total and shown before payment. No listing fee.

ONE ₦10,000 VENDOR SALE, ON A 5% CONNECTION

Buyer pays	₦10,150	₦10,000 item plus the processing fee, shown separately
Earnival	₦750	7.5% service charge — our revenue
Organiser	₦500	5% connection share, agreed before the event
Vendor	₦8,750	Net, settled to a verified bank account

Every split sums exactly to the gross. Rounding remainders go to the vendor.

Two revenue lines, one transaction

We earn on tickets and on vendor sales through the same rail — and the organiser's share is what makes them recruit the vendors for us.

Not yet live

Standard (5%) and Premium (2%) plan tiers are specified but unbuilt. The 7.5% Starter rate is the only live rate today.

STATUS

This is not a prototype. It runs.

Every requirement in our PRD carries a build status, so the gap between intent and reality is legible rather than asserted. Of 180 requirements across ten user journeys:

test suites

Next.js 15 · React 19 · TypeScript · PostgreSQL 16 via Prisma · Paystack · deployed as one application. Integration tests run against a real database, because the failures that matter are concurrency problems.

The four things standing between us and a live event.

We would rather you hear these from us. Each has a named owner and sits on the critical path to first revenue.

Never tested against live Paystack

Every payment, refund and transfer has been exercised against sandbox stubs only. One small real event, end to end, is the gate before any external launch.

DPIA not yet completed

Level 2 collects BVN and NIN. The data protection impact assessment is launch-blocking and must land before that rung is enabled.

CBN treatment of pre-event payouts

Daily settlement pays out ticket revenue before the event happens. That needs regulatory comfort before we enable it broadly.

No admin audit log

Approvals, KYC decisions and refunds leave no trail beyond the row they change. Required before anyone but the founder is an admin.

THE ASK

Fund the first hundred events.

The software is built. What we are buying is the operational proof — real money moving through real events, instrumented, so the second hundred sell themselves.

RAISING

[amount]

To be set by the founder. The milestones opposite are costed around a 12-month runway.

Events & vendor onboarding [%]

Engineering [%]

Compliance & legal [%]

Now → launch

One real event end to end on live Paystack. DPIA completed. Sending domain verified.

First quarter

The three pilot cohorts onboarded by hand — DDP, FSN, Lere. Baselines replace every estimated metric in this deck.

Second quarter

Plan tiers live. Admin audit log. Open the link beyond hand-onboarded organisers.

Second half

Diaspora payments. The ₦5m and unlimited rungs carrying real volume.
